

THE SAIL HOUSE

The sail house is a completely new design. The tower is as slender as possible, but provides maximum space for navigational equipment. Apart from the bridge and the short induction masts there is a 2.4 m diameter dome on top of the sail. This dome can be equipped with navigation lights, flashlights, two fixed searchlights, colour CCD cameras, night vision equipment, an electro-optic multi-functional periscope, radar system, navigation system, pinger release and locating system, tracking transponder and two vertical thrusters.

The sail is made of radar-absorbent material to ensure radar and visual stealth. For transportation the sail house can be removed completely in less than one hour.
